

Basic information about the platform used:

Host machine: Debian 12, running on core i5, 16GiB Ram

Docker version 28.4.0, compose version 2.39.4

System Diagram:**Git repository:**

https://github.com/iasiff/Tuni_DevOps.git

`git clone -b exercise1 https://github.com/iasiff/Tuni_DevOps.git`

- After cloning, please open the terminal in the **Tuni_DevOps** directory and run **mkdir vstorage**
- **docker-compose up**
- **curl localhost:8199/status**
- **cat vstorage/log.txt**

Analysis of the content of the status records:

Which disc space and uptime actually measured?

While running the containers it showed the uptime of underlying **host machine uptime** and **host disk space**.

How relevant are those measurements? What should be done better?

The measurement is important for 'running container', its underlying disk space and uptime is sometimes necessary. It would be better to show the actual container's uptime and disk space. However, this requires changes in code.

Analysis and comparison of the persistent storage solutions – what is good and what is bad

in each solution?

It would be better to use vstorage rather than only in application local storage. The vstorage is good because it keeps the logs, but for local storage, if the application turns off the logs might gone

Teacher's instruction for cleaning up the persistent storage:

Find id of running container: `docker ps`

It will list as follows

XYZ123 continuousdevelopmentanddeployment-devops-service1

XYZ123 continuousdevelopmentanddeployment-devops-storage

XYZ123 continuousdevelopmentanddeployment-devops-service2

Clean the Log File (Inside the Running Container): run **docker exec XYZ123 sh -c 'echo "" > /app/vstorage/log.txt'**

OR

docker compose down

To remove vstorage from Teacher's host machine:

`sudo rm -rf vstorage/`

What was difficult?

The difficult part was coding in another programming language which I have not done before and searching for different functions in that language.

What were the main problems?

No serious problem faced while doing the exercise, apart from writing code in another programming language.
